

AI Video Template – Business Proposal

Sep 29, 2026 · @Neha

Summary

We propose a website where anyone turns a photo into a short, trending AI video in one click, paid for with video credits. People find us through one search page per viral trend. Their first video is free with our watermark; after that they buy a \$4.99 pack of 8 videos or pay \$9.99 a month for 16.

We don't build our own AI model. We rent video models (Kling, Wan) through fal.ai at about \$0.25–\$0.35 a video, which leaves about 35–38% margin on paid plans after card fees. The plan fits a two-person team with under \$5K for the first 6 months, and the first working version takes about 6 weeks.

Deepak, we need your view on the questions at the end of this doc before we start building.

The opportunity

Two competitors show that this market pays, and that neither needed its own AI model to grow. LightX wins cheap traffic from search pages; Higgsfield wins by always offering the newest models.

	LightX	Higgsfield
Who uses it	Everyday users, small businesses	Creators, marketers, filmmakers
Where its AI comes from	Features built into its own app	30+ rented models plus its own image model
Price	Pro ₹4,900/year (about \$4.70/month) with up to 10 videos a month; free tier gives 6 credits a day	\$19, \$47 or \$99 a month (annual billing)
Cost to a buyer per video	about \$0.49	about \$0.55 (Plus plan)
How people find it	51 search pages, one per video trend	Viral presets and creator buzz

	LightX	Higgsfield
Scale	Made by AndOr Communications, Kolkata; web, iOS and Android	About \$200M yearly revenue at end of 2025, about \$700M in July 2026 (estimates)

LightX's "[hotel lobby](#)" page is the model to copy: someone searches for a viral meme video, uploads 1-2 photos and gets their own version in seconds. **We combine both approaches:** one search page per trend, like LightX, running on rented models, like Higgsfield.

The product

A user goes from a Google search to a finished video without writing a prompt: they pick a trend, upload photos, and we do the rest.

Every shared free video brings new visitors to a trend page

user journey · search to paid credits

The free video's watermark carries our site name, so each share on TikTok or Reels works as an ad. Each template is a stored record (title, search text, example video, photos needed, model, hidden prompt), so adding a new trend needs no new code.

Pricing and costs

Every paid plan keeps at least 35% margin after card fees, even if buyers use every credit. One credit makes one 5-second video.

Plan	Price	Credits	Model used	Our model cost	Margin after card fees
Free	\$0	1 on sign-up, 480p, watermarked	Wan 2.5 at 480p	about \$0.25	Paid for from marketing
Starter pack	\$4.99 one-time	8, never expire	Kling 2.5 Turbo Pro	about \$2.80	about 35%
Monthly	\$9.99/month	16 a month, no watermark, HD	Kling 2.5 Turbo Pro	about \$5.60	about 38%

Costs are fal.ai list prices on 2026-09-28: Wan 2.5 costs \$0.05 a second at 480p and \$0.10 at 720p; Kling 2.5 Turbo Pro costs \$0.35 for 5 seconds. Card fees assume Stripe's 2.9% + \$0.30 per payment.

A buyer pays about \$0.62 a video with us, against about \$0.49 on LightX Pro and \$0.55 on Higgsfield Plus. We're slightly dearer, but a buyer can start with a \$4.99 pack instead of a yearly plan. We'll skip an annual plan and costly models such as Veo until usage data shows demand.

Video model provider

We start on fal.ai for its model choice and ease of building, and keep switching to a cheaper provider a settings change. fal.ai is not the cheapest, but Replicate charges the same and the cheaper options are smaller companies.

Provider	Price per second of video (2026-09-28)	Strengths	Weaknesses
fal.ai	Wan 2.5: \$0.05 at 480p, \$0.10 at 720p; Kling 2.5 Turbo Pro: \$0.07	Largest model choice, new models arrive fast, easy to use from our web stack	Not the cheapest
Replicate	Same as fal.ai for Wan 2.5 and Kling 2.5	Well known and stable	No cheaper; fewer of the newest models
WaveSpeed	MiniMax H3: \$0.04; Wan 3.0: \$0.05; Kling 3.0 Std: \$0.084	Often the cheapest; newer models	Smaller company, more reliability risk

Provider	Price per second of video (2026-09-28)	Strengths	Weaknesses
Runware	MiniMax H3 Fast: \$0.046; Wan 3.0 at 480p: \$0.05	Cheap, with discounts on some models	Smaller company, fewer video models
Model makers directly (Kling, Alibaba)	Can be cheaper at high volume	Lowest cost at scale	A separate account and code per model; not worth it at our size

Each template names its provider and model in settings. If a cheaper model such as MiniMax H3 passes our quality tests, we can switch without changing code; we haven't tested its quality yet.

How we get users

We grow through search and sharing, and spend on ads only after a page proves it sells.

1. **Trend pages.** Launch with 20 template pages, each built for one search (for example "AI hug video from photo"), then add 3–5 a week as new trends appear.
2. **Watermark as distribution.** Every free video carries a small watermark with our site name, so each share advertises us.
3. **Our own short-form channel.** Post 1–2 example videos a day to TikTok and YouTube Shorts, each linking to its template page.
4. **Ads only once a page converts.** When a page turns at least 2% of visitors into buyers, test \$300–\$500 of ads on it.

Six-month budget

The first 6 months cost under \$5,000, and half of it stays in reserve.

Item	Estimate
Video generation through fal.ai (about 4,000–6,000 videos), free and paid	\$1,500
Hosting (Vercel), database and storage (Supabase), domain	\$300
Ad tests on pages that convert	\$500
Content tools and moderation	\$200

Item	Estimate
Reserve	\$2,500
Total	\$5,000

This assumes no salaries: we build it ourselves.

Build plan

We launch after 6 weeks, then spend months 2–6 adding trends and dropping what doesn't sell.

A working product launches after 6 weeks

build plan · 4 phases, 1 launch gate

The stack is Next.js on Vercel, Supabase for login, database and file storage, fal.ai for video, and Stripe Checkout for payments. To start, we need a fal.ai API key and a Supabase project.

Risks

Risk	What could happen	How we handle it
Likeness and copyright	Templates copying a real show or celebrity (as LightX's COLORS and Migos styles do) draw takedown requests	Use generic trend styles; users confirm they have consent for the photos; block images of minors
Free-video abuse	Each free video costs us about \$0.25, so fake accounts burn money	Google sign-in required; one free video per account and per device

Risk	What could happen	How we handle it
Model price changes	A provider raises prices and cuts our margin	Provider and model set per template, so we can switch without code changes
Slightly higher price per video	At about \$0.62 a video we cost more than LightX and Higgsfield	Low entry price (\$4.99), no yearly lock-in; review after the first month of sales

Questions for Deepak

Please reply in comments on this doc, or tick a box when you agree.

- ☐ Do you agree with the overall model: trend-template pages for everyday consumers, paid with credits?
- ☐ Is \$4.99 for 8 videos and \$9.99 a month for 16 the right pricing, or should we start cheaper to match LightX?
- ☐ Should we launch for a US and global audience in dollars, or target India first with rupee pricing like LightX?
- ☐ Is under \$5,000 for 6 months the right budget now that there are two of us, and how do we split it?
- ☐ Who does what: building the product, making trend pages, and posting on TikTok and Shorts?
- ☐ Any trends or templates you think we should launch with?
